1 Overview

This Internet Appendix presents additional details and robustness checks for the "Price Drift before U.S. Macroeconomic News: Private Information about Public Announcements?" paper. Section 2 shows summary statistics for the announcements listed in Table 1 in the paper.

Table B1: Macroeconomic Announcements - Summary Statistics

Announcement	Unit	Mean	Median	Min	Max	Std
GDP advance	%	1.44	2	-6.1	5.7	2.39
GDP preliminary	%	1.40	2	-6.2	5.9	2.62
GDP final	%	1.40	1.9	-6.3	5.6	2.58
Personal income	%	0.25	0.3	-3.6	2.6	0.66
ADP employment	Number of jobs (1,000)	13.39	93	-742	325	240.56
Initial jobless claims	Number of claims (1,000)	421.95	399.5	292	669	85.16
Non-farm employment	Number of jobs (1,000)	-4.97	69	-663	431	234.83
Factory orders	%	0.09	0.6	-5.2	4.8	1.99
Industrial production	%	0.07	0.1	-2.8	1.3	0.76
Construction spending	%	-0.13	0	-3.3	2.7	1.01
Durable goods orders	%	-0.04	0.05	-13.2	9.9	3.60
Wholesale inventories	%	0.32	0.5	-1.7	1.9	0.86
Advance retail sales	%	0.18	0.3	-2.8	2.7	0.86
Consumer credit	USD (Billion)	4.99	6.35	-21.6	21.36	10.50
Personal consumption	%	0.26	0.3	-1	1.3	0.36
Building permits	Number of permits (1,000)	737.12	680	494	1091	179.20
Existing home sales	Number of homes (Million, Annual rate)	4.93	4.91	3.83	6.54	0.41
Housing starts	Number of homes (1,000)	720.73	658	458	1066	175.90
New home sales	Number of homes (1,000)	383.15	368	250	604	83.09
Pending home sales	%	0.37	0.25	-30	10.4	6.08
Government budget	USD (Billion)	-88.29	-94.3	-237.2	159.3	89.95
Trade balance	USD (Billion)	-44.04	-42.9	-63.1	-26	9.02
Consumer price index	%	0.14	0.1	-1.7	1.1	0.39
Producer price index	%	0.20	0.2	-2.8	1.8	0.88
CB Consumer confidence index	Index	59.60	59.6	25	87.9	13.37
Index of leading indicators	%	0.31	0.3	-0.8	1.4	0.45
ISM Manufacturing index	Index	51.56	52.5	32.4	61.4	6.30
ISM Non-manufacturing index	Index	51.96	53	37.3	59.7	4.53
UM Consumer sentiment - Final	Index	71.23	72.5	55.3	85.1	7.67
UM Consumer sentiment - Prel	Index	70.39	71.8	54.9	84.9	7.73

The sample period covers January 1, 2008 to March 31, 2014. The columns show the mean, median, minimum, maximum and standard deviation values for each announcement listed in Table 1 in the paper.

Figure B1: Cumulative Average Returns for Individual Announcements

E-mini S&P 500

10-year Treasury Note

The sample period is from January 1, 2008 through March 31, 2014. We classify each event as "good" or "bad" news based on whether the announcement surprise has a positive or negative effect on the stock and bond markets using the coefficients in Table 3 in the paper. Cumulative average returns (CARs) are then calculated in the $[t - 60min; t + 60min]$ window. Only announcements showing evidence of pre-announcement drift in each market in Table 2 in the paper are included (four in the E-mini S&P 500 market and nine in the 10-year Treasury note market).

4 Cumulative Average Returns for $[t - 180min; t + 60min]$ Window

Figure 1 in the paper presents CARs for the $[t - 60min; t + 60min]$ window. Figure B2 presents CARs in the expanded $[t - 180min; t + 60min]$ window. The CARs during the $[t - 180min; t - 60min]$ window hover around zero similarly to the $[t - 60min; t - 30min]$ window.

5 Robustness Check: Multiple Hypotheses Testing and Data Snooping

Table 2 in Section 4.1 in the paper presents results showing the pre-announcement price drift. In that table, we test multiple hypotheses. Increasing the number of hypotheses leads to the rejection of an increasing number of hypotheses with probability one, irrespective of the sample size. Failure to adjust the p -values can be viewed as data snooping. To rule out this possibility, we use the Holm (1979) step-down procedure. This procedure adjusts the

Figure B2: Cumulative Average Returns for $[t - 180min; t + 60min]$ Window

E-mini S&P 500

10-year Treasury Note

The sample period is from January 1, 2008 through March 31, 2014. We classify each event as "good" or "bad" news based on whether the announcement surprise has a positive or negative effect on the stock and bond markets using the coefficients in Table 3 in the paper. Following Bernile, Hu, and Tang (2016), we invert the sign of returns for negative surprises. Cumulative average returns (CARs) are then calculated in the $[t - 180min; t + 60min]$ window for the "drift" category based on Table 2 in the paper. In the stock market, there are four drift announcements. In the bond market, there are nine drift announcements. The solid line shows the mean CAR. Dashed lines mark two-standard-error bands (standard error of the mean).

hypothesis rejection criteria to control the probability of encountering one or more type I errors, the familywise error rate (see, for example, Romano and Wolf (2005)). Denote the hypotheses by $H_1; \dots; H_M$, one for each of the $M = 30$ announcements in Table 2. Denote the corresponding p -values by $p_1; \dots; p_M$. Consider the significance level of 0.05. The procedure orders the Table 2 joint test p -values from the lowest to the highest. Denoting the ordered hypotheses by $k = 1; \dots; 30$, it computes $\frac{0.05}{M+1-k}$ for each k and compares this computed value to the Table 2 p -value. The null hypothesis of no drift is rejected if $\frac{0.05}{M+1-k}$ exceeds the p -value in Table 2. Based on this *conservative* approach, four announcements ranked at the top of Table 2 (ISM Manufacturing, Pending Home Sales, ISM Non-Manufacturing and CB Consumer Confidence Index) show a statistically significant drift.

6 Robustness Check: Conditioning on Sign of Post-Announcement Return

The results in Section 4 in the paper show that the pre-announcement drift is in the direction of the *surprise*. In this section, we focus instead on returns and show that the pre-announcement drift exists also conditional on the sign of the post-announcement *return*.

Table B2: Holm's Step-down Procedure

Announcement	Table 2 Joint Test p -value	$\frac{0.05}{M+1-k}$	Null Hypothesis of No Drift Rejected

GDP final	0.978	0.0500	No

correlation is not significant with values of -0.01 and -0.02 in the stock and bond markets, respectively.

We show CARs conditioned on the sign of the returns in the [*5sec; 1min*

7.1 OLS Regression

Let R_t^{+-} denote the continuously compounded asset return around the official release time t of announcement m , defined as the first difference between the log prices at the beginning and at the end of the intraday event window $[t - \Delta; t + \Delta]$. Let S_{mt} denote the unexpected component of news announcements ("the surprise") as in the paper. The effect of news announcements on asset prices can then be analyzed by standard event study methodology (Balduzzi, Elton, & Green, 2001). The reaction of asset returns to the surprise is captured by the ordinary least squares regression

$$R_t^{+-} = \alpha_0 + \alpha_1 S_{mt} + \epsilon_t \quad (1)$$

announcements.

Figure B4: Cumulative Average Returns

E-mini S&P 500

10-year Treasury Note

(a) Announcements with no evidence of drift

(b) Announcements with some evidence of drift

(c) Announcements with strong evidence of drift

The sample period is from January 1, 2008 through March 31, 2014. We classify each event as "good" or "bad" news based on whether the announcement surprise has a positive or negative effect on the stock and bond markets using the coefficients in Table B3. Following Bernile et al. (2016), we invert the sign of returns for negative surprises. Cumulative average returns (CARs) are then calculated in the $[t - 60min; t + 60min]$ window for each of the "strong drift", "some drift" and "no drift" categories defined in Table B5. For each category the solid line shows the mean CAR. Dashed lines mark two-standard-error bands (standard error of the mean).

Table B7: Announcement Surprise Impact During [$t - 30min; t + 5sec$] by Decile

Surprise Size	Surprise Decile	n	E-mini S&P 500		10-year Treasury Note		Joint Test
				R^2		R^2	p -value
1	5 and 6	96	-0.269 (0.234)	0.01	-0.164 (0.061)***	0.06	0.015
2	4 and 7	95	0.228 (0.093)**	0.06	-0.055 (0.029)*	0.03	0.009
3	3 and 8	95	0.063 (0.051)	0.01	0.001 (0.014)	0.00	0.464

5	1 and 10	94	0.115 (0.027)***	0.16	-0.030 (0.005)***	0.26	<0.0001
All		476	0.102 (0.020)***	0.08	-0.029 (0.004)***	0.09	<0.0001

The sample period is from January 1, 2008 through March 31, 2014. Only the announcements classified as

equation (1) with $[t_{-1}; t_{-5} \text{sec}]$ for various t_{-2} [5min; 120min]. Figure B5 plots estimates of the corresponding m

7.5 Effect of Order Flows

that the impact of order flow on returns on announcement days with drift is the same as on other days involves a t -test on the estimated coefficient for b_2 . The results in Table B8 show that this is the case because the t -statistic is insignificant. We conclude that order flow impact on announcement days with drift is no different from its impact on other days.

Table B8: Order Flow Analysis

	E-mini S&P 500 Futures	10-year Treasury Note Futures
b_0	1.282 (0.067)***	0.037 (0.002)***
b_1	0.069 (0.117)	0.004 (0.003)
b_2	-0.178 (0.137)	-0.003 (0.004)
R^2	0.321	0.219

The sample period is from January 1, 2008 through March 31, 2014. The reported response coefficients b_0 , b_1 and b_2 are the ordinary least squares estimates of equation (4). Standard errors are shown in parentheses.

Industrial production

Table B10: Predicting CPI surprises with State Street PriceStats data

imply that the forecasts have superior predictive power for *returns*. To explore this, we estimate equation (1) using the prediction, P_{mt} , instead of the surprise, S_{mt} . Table B14 Panel (a) shows the slope coefficients for predicting the pre-announcement return during the $[t - 30min; t - 5sec]$ window using the surprise prediction for the E-mini S&P 500 and 10-year Treasury note futures markets. The reported p -values are for a two-sided test. Similarly, Table B14 Panel (b) reports the results for the $[t - 5sec; t + 5min]$ window. P_{mt} is a useful predictor of returns only for a handful of announcements.

Table B13: Regression of Unstandardized Surprise, \hat{S}_{mt} , on a Constant and Prediction, P_{mt}
